

# Lecture 5

## Stack and Queue

---

# Our Roadmap

- ◆ Stack

- ◆ Queue

- ◆ Stack vs. Queue

# Stack

- ◆ A stack is a sequence in which:
  - ◆ Items can be added and removed only at one end (the top)
  - ◆ You can only access the item that is currently at the top
- ◆ Stack Analogy

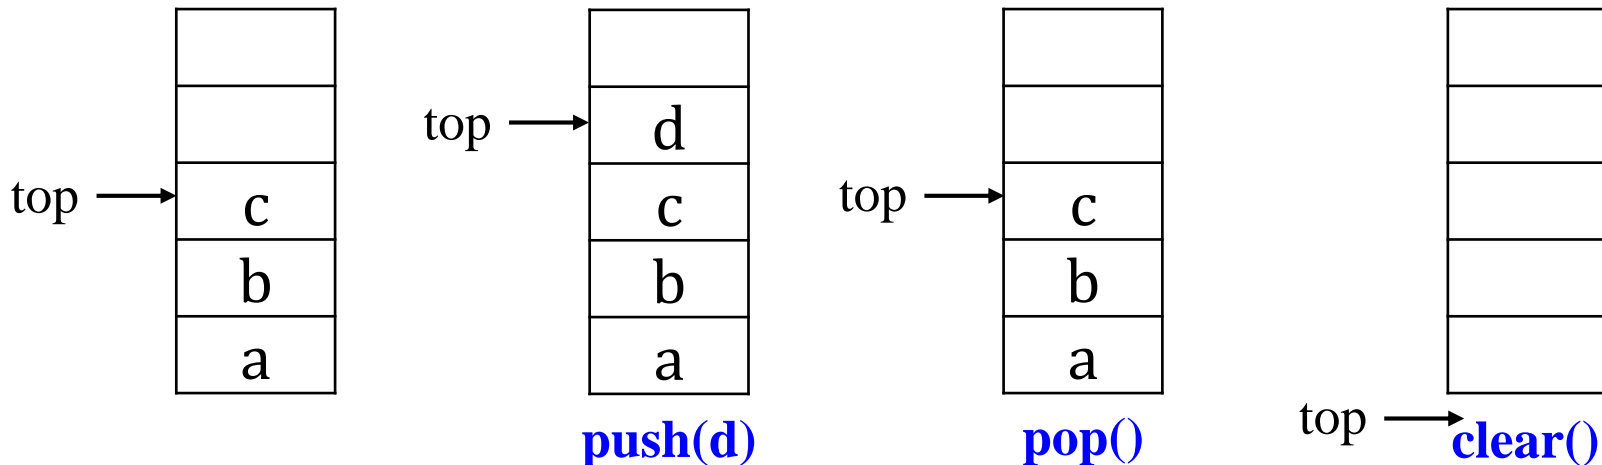

# Stack

- ◆ First In Last Out (FILO)
  - ◆ Constrained item access
- ◆ Major Operations
  - ◆ **push**: add an item to the top of the stack
  - ◆ **pop**: remove the item at the top of the stack
- ◆ Illustration

# Stack Operation

- ◆ push: add an item to the top of the stack
- ◆ pop: remove the item at the top of the stack
- ◆ top/peek: get the item at the top of the stack, but do not remove it
- ◆ isEmpty: test if the stack is empty
- ◆ isFull: test if the stack is full
- ◆ clear: clear the stack, set it as empty stack
- ◆ size: return the current size of the stack

# Implementation of Stack

- ◆ Array-based Stack
- ◆ Linked Stack

# Implementation of Stack

- ◆ Array based Stack

- ◆  $\text{MAX\_SIZE} = n$  // the max size of stack
- ◆  $\text{top} = -1$  // the current top position
- ◆ Array S with n elements

- ◆ Example

- ◆  $\text{MAX\_SIZE} = 5$
- ◆  $\text{top} = -1$
- ◆ Array S

# Push Operator

◆ `push(item):`

1. `top++;`
2. `S[top] = item`

◆ `push(1)`

# Push Operator

◆ `push(item):`

1. `top++;`

2. `S[top] = item`

◆ `push(1)`

◆ `push(4)`

# Push Operator

◆ `push(item):`

1. `top++;`

2. `S[top] = item`

◆ `push(1)`

◆ `push(4)`

◆ `push(5)`

# Push Operator

◆ `push(item):`

1. `top++;`
2. `S[top] = item`

◆ `push(1)`

◆ `push(4)`

◆ `push(5)`

◆ `push(6)`

# Push Operator

◆ push(9)

◆ push(10)

◆ OVERFLOW

◆ How to avoid that?

# Push / Pop Operator

## ◆ push(item):

1. `if(top == MAXSIZE-1)`
2.       Stack is FULL! No push!
3. `else`
4.       `top++;`
5.       `S[top] = item`

## ◆ pop(): // should avoid underflow

1. `if(top == -1)`
2.       Stack is EMPTY! No pop!
3. `else`
4.       `top--;`

# Application of Stacks

- ◆ Making sure the delimiters (parens, brackets, etc.) are balanced:
  - ◆ Push open (i.e., left) delimiters onto a stack
  - ◆ When you encounter a close (i.e., right) delimiter, pop an item off the stack and see if it matches
- ◆ Evaluating arithmetic expressions
  - ◆ Parsing arithmetic expressions written using infix notation
- ◆ The runtime stack in memory
  - ◆ Converting a recursive algorithm to an iterative one by using a stack to emulate the runtime stack

# Brackets Balance Problem

- ◆  $a + \{2 - [b + c]^* (8^* [8 + g] / [m - e] - 7) - p\}$
- ◆  $\{ [ ] ( [ ] [ ] ) \}$
- ◆ Skip operators and notations
- ◆ Is the bracket expression balanced or not?
  - ◆  $()$  Yes
  - ◆  $[ ]$  No
  - ◆  $\{ [ () ] \}$  No
  - ◆  $\{ [ ] ( [ ] [ ] ) \}$  Yes
  - ◆  $\{ \{ \{ \{ \{ [ [ [ [ [ ( ( ( ( ( () ) ) ) ) ) ] ] ] ] ] \} \} \} \} \}$  Yes

# Brackets Balance Problem

- ◆ Given a bracket expression, determine whether it is balanced or not?
- ◆  $\{ [ ] ( [ ] [ ] ) \}$ 
  - ◆ How to solve it by using stack?
  - ◆ Bracket pairs: ( ), [ ], { }
  - ◆ Any ideas?
- ◆ Methodology
  - ◆ Employ stack store checked left bracket
  - ◆ Pop out left bracket if it is matched

# Arithmetic Expression Evaluation

- ◆ Arithmetic expression
  - ◆ operands (a, b, c), operator (+, \*)
  - ◆  $a + b * c$
- ◆ Prefix expression
  - ◆  $+ a * b c$
- ◆ Infix expression
  - ◆  $a + b * c$
- ◆ Postfix expression
  - ◆  $a b c * +$

# Postfix Expression

- ◆ Infix expression
  - ◆  $5 * ((9 + 3) * (4 * 2) + 7)$
- ◆ Postfix expression
  - ◆  $5\ 9\ 3\ +\ 4\ 2\ *\ * 7\ +\ *$
- ◆ Parse postfix expression is somewhat easier problem than directly parsing infix (why)
- ◆ Postfix has a nice property that parentheses are unnecessary
- ◆ Postfix Expression Evaluation
  - ◆ Convert from infix to postfix
  - ◆ Evaluate a postfix expression

# Postfix Expression

- ◆ Postfix expression

- ◆ 5 9 3 + 4 2 \* \* 7 + \*

- ◆ Methodology

- ◆ Read the tokens in one at a time
  - ◆ If it is an operand, push it on the stack
  - ◆ If it is a binary operator:
    - ◆ pop top two elements from the stack,
    - ◆ apply the operator,
    - ◆ and push the result back on the stack

# Postfix Expression Evaluation

◇ 5 9 3 + 4 2 \* \* 7 + \*

## ◇ Postfix Expression Evaluation

Stack operations

Stack elements

◇ push(5)

5

◇ push(9)

5 9

◇ push(3)

5 9 3

◇ push(pop() + pop())

5 12

◇ push(4)

5 12 4

◇ push(2)

5 12 4 2

◇ push(pop() \* pop())

5 12 8

◇ push(pop() \* pop())

5 96

◇ push(7)

5 96 7

◇ push(pop() + pop())

5 103

◇ push(pop() \* pop())

# Our Roadmap

- ◆ Stack

- ◆ Queue

- ◆ Stack vs. Queue

# Queue

- ❖ A queue is a sequence in which:
  - ❖ items are added at the rear and removed from the front
  - ❖ You can only access the item that is currently at the front
- ❖ Queue Analogy

# Queue

- ◆ First In First Out (FIFO)
  - ◆ Items access constrained
- ◆ Major elements
  - ◆ **front**: the first element in the queue (remove)
  - ◆ **rear**: the last element in the queue (add)
- ◆ Illustration

# Queue Operations

- ◆ enQueue: add an item at the rear of the queue
- ◆ deQueue: remove the item at the front of the queue
- ◆ front: get the item at the front of the queue, but do not remove it
- ◆ isEmpty: test if the queue is empty
- ◆ isFull: test the queue is full
- ◆ clear: clear the queue, set it as empty queue
- ◆ size: return the current size of the queue

# Implementation of Queue

## ◆ Array based Queue

- ◆  $\text{MAX\_SIZE} = n$  // the max size of stack
- ◆  $\text{front} = 0$  // the current front
- ◆  $\text{rear} = 0$  // the current rear
- ◆ Array  $S$  with  $n$  elements

## ◆ Example

- ◆  $\text{MAX\_SIZE} = 5$
- ◆  $\text{front} = 0$
- ◆  $\text{rear} = 0$
- ◆ Array  $S$

**S**

# enQueue Operator

◆ enQueue(item):

1. if(rear < MAXSIZE)
2.       S[rear] = item
3.       rear++
3. else
4.       Queue is FULL, no enQueue

◆ enQueue (1), enQueue(4), enQueue(5), enQueue(6)

# deQueue Operator

- ◆ deQueue():
  1. if(front < rear)
  2.       front++
  3. else
  4.       Queue is empty, no deQueue
- ◆ deQueue (), deQueue(), deQueue(), deQueue()

# enQueue and deQueue

## ◆ enQueue(9)

## ◆ enQueue(10)

- ◆ rear  $\geq$  MAXSIZE
- ◆ Queue is FULL!!!
- ◆ Wrong OVERFLOW
- ◆ S[0] to S[3] is empty?
- ◆ How to address it?

# Ring Queue

(a) empty

(b) d, e, b, g enQueue

(c) d, e deQueue

(d) i, j, k enQueue

(e) b, g deQueue

(f) r, p, s, t deQueue

# Application of Queues

- ◆ First-in first-out (FIFO) inventory control
  - ◆ OS scheduling: processes, print jobs, packets, etc.
  - ◆ Breadth-first traversal of a graph or level-order traversal of a binary tree (more on these later)
- ◆ Real applications
  - ◆ iTunes playlist.
  - ◆ Data buffers (iPod, TiVo).
  - ◆ Asynchronous data transfer (file IO, pipes, sockets).
  - ◆ Dispensing requests on a shared resource (printer, processor)

# Our Roadmap

- ◆ Stack

- ◆ Queue

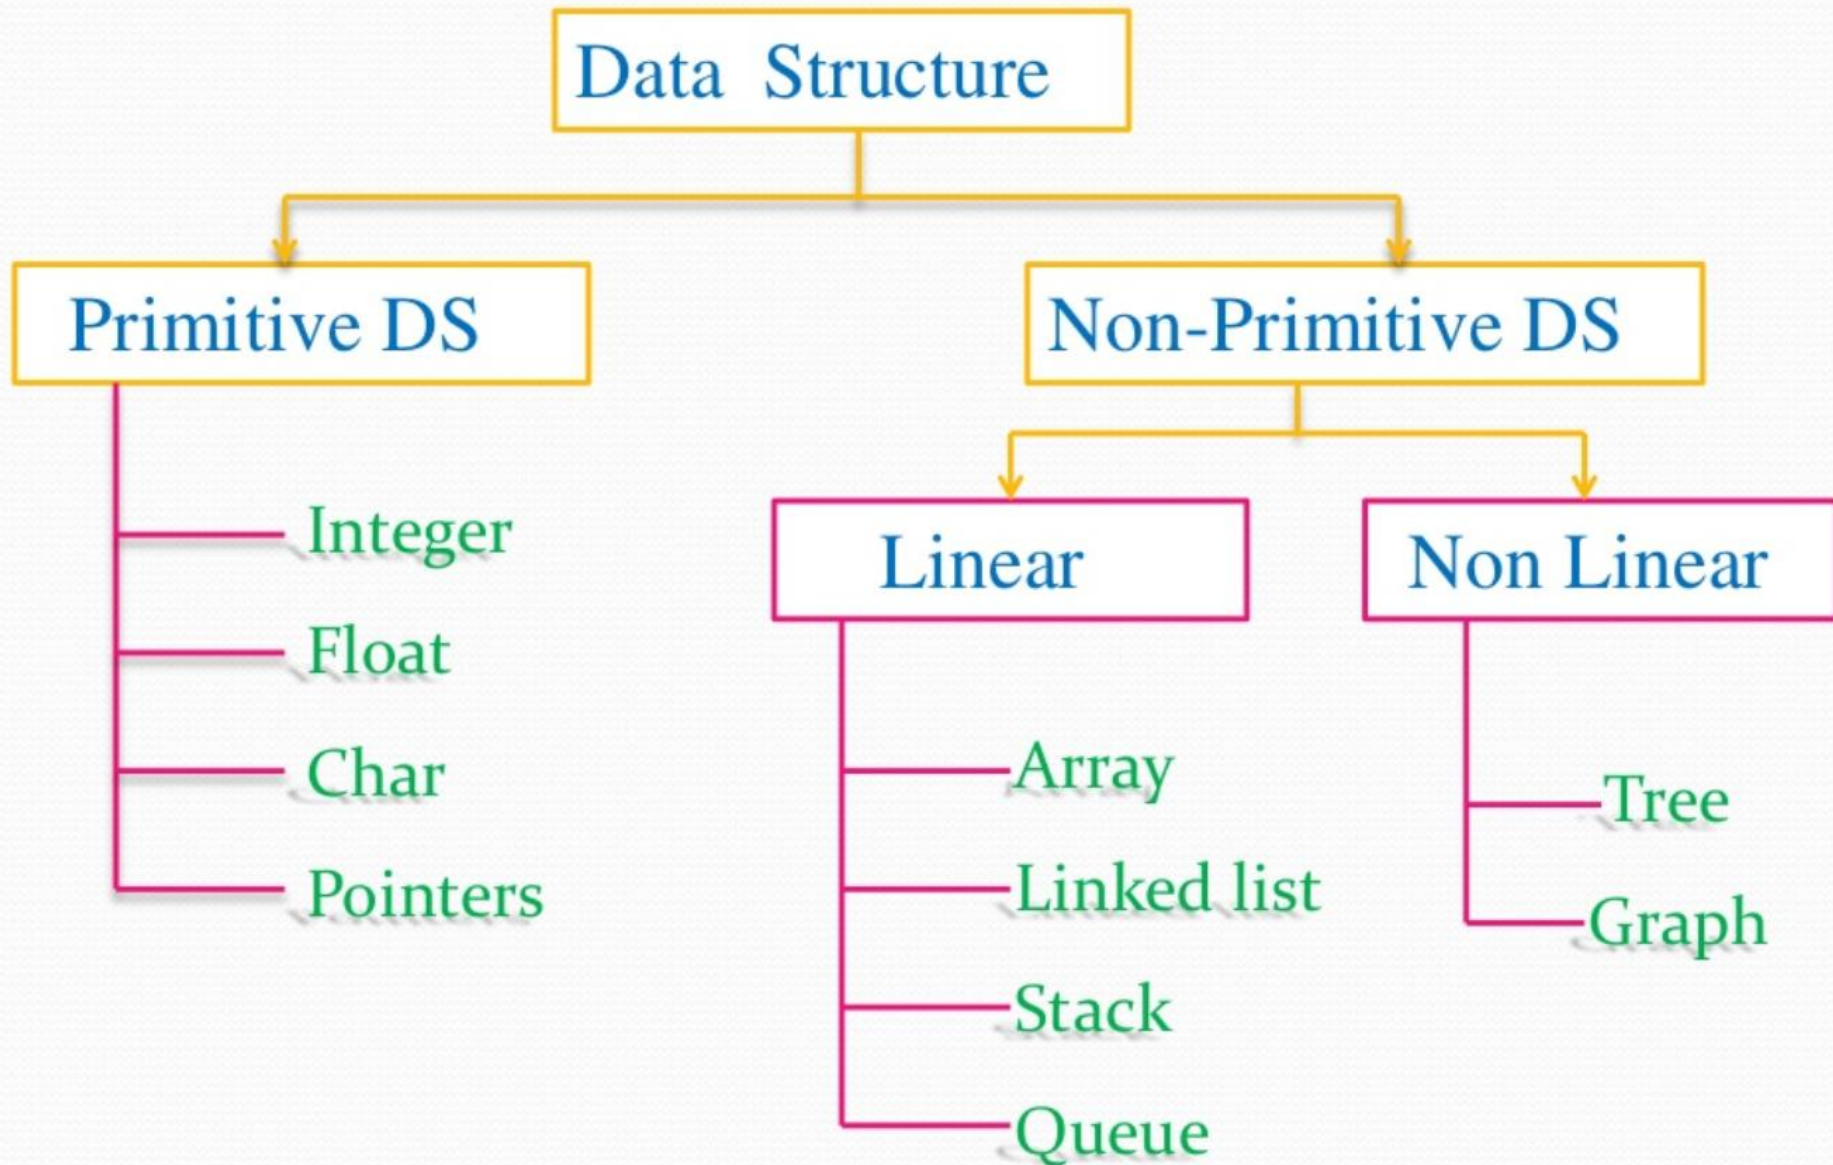

- ◆ Stack vs. Queue

# Stack VS. Queue

	Stack	Queue
In-Out	FILO	FIFO
Application	function runtime	OS scheduling
Operations	push pop	enQueue, deQueue
Ops Time Complexity	$O(1)$	$O(1)$
Implementation	Array-based, Linked-based	Array-based, Linked-based

# Data Structure
